11.22 Release Notes

Last Modified on 10/20/2026 11:06 am EDT

Release Dates

Lighthouse: 8/23/26 11.22.0

GA Release: 8/30/26

Hotfix release: 11.22.7

Feature Enhancements:

Release 11.22.0	
Integer and Double Fields with Validation Strings on Notes	*Main Menu > Admin Tools >Form Builder* Administrative users can now add Integer and Double fields to Notes and configure custom validation strings for them, matching the existing behavior on Forms. This ensures users provide data in the exact numeric format required.

BMI Category Standards	Height, weight, and BMI are now mapped against established CDC health standards, allowing the system to automatically determine a client's BMI category accurately for both adults and children. ## New Features & Enhancements - Widespread BMI Visibility: Calculated BMI, BMI Percentile, and BMI Category are now displayed when recording and viewing Vitals across Nurse Notes, Forms, the eMAR, and the Document Center. - Vitals History Updates: A new column titled "BMI Class" has been added to the Vitals History to display the BMI Category. - Standardized Abbreviations: The BMI Class column utilizes standardized abbreviations such as UW (Underweight), HW (Healthy Weight), OW (Overweight), OB (Obesity), and OB 1-3 (Classes of Obesity). - Updated Growth Charts: Growth charts have been updated to reflect the most up-to-date extended BMI data files provided by the CDC. ## Configuration & Setup Changes - BMI Category Configuration: A new grid is available in System Setup (Supplemental) > Vitals Setup to manage BMI Category Configurations. - Display Preferences: "BMI Category" has been added as a selectable option in the Vitals Display Preferences grid. - Adolescent Age Cutoff: The age cutoff to differentiate between Adolescent and Adult BMI categories defaults to 20. - Obesity Class Toggles: New configuration options allow administrators to enable or disable the display of Adult Classes of Obesity and Severe Obesity for Adolescents. ## Usability & Calculation Updates - Automated Calculations: The System Setup Variable for AutoCalcBMI has been removed. - Strict Formula Use: The system now always calculates BMI from a formula based on entered height and weight. - Read-Only Fields: To prevent manual errors, the BMI field has been made read-only in Vitals across Notes, Forms, and the eMAR. - UI Interaction Adjustments: Spin edit up/down arrows and mouse scroll wheel interactions have been removed when entering Vitals in the eMAR to prevent accidental data changes
Performance Improvements to Reminders and Case Assignments	Behind-the-scenes performance improvements have been made to the process that calculates reminders and case assignments, improving speed and reliability.
Productivity Dashboard Now Uses Activities for Out of Office Time	*Main Menu > Reports > Administrative Reports > Productivity Dashboard* Out of Office time is now calculated using the Out of Office activity setting in Scheduler Activity Types, replacing the previous appointment header text method. This prevents misspelled headers from skewing your Productivity Dashboard calculations.

Issues Resolved:

Release 11.22	
Locations Incorrectly Marked as Non-Person	*Main Menu > Admin Tools > System Setup (Supplemental) >Location Configuration* There was an issue where a newly added location was always marked as a non-person location regardless of how the setting was configured. This issue has been resolved.
Orphaned Conditional Rules on Forms	*Main Menu > Admin Tools >Form Builder* There was an issue where deleting a field from a form did not also delete its associated conditional rule, leaving orphaned logic in the form configuration. Conditional rules are now automatically removed when their associated field is deleted.
Server Error Adding "Create Orders" Permission	*Main Menu > Admin Tools >Maintain Users* There was an issue where adding the "Create Orders" permission in Maintain Users could cause a server error. This issue has been resolved.

Release 11.22.7	
Conditionally Required Select All That Apply fields	*Main Menu > Admin Tools > Form Setup* There was an issue where a Select All That Apply field with a conditional required rule required every option to be selected when the rule was true. Only one or more options are now required, which matches how a Select All That Apply field that is always required behaves. There was also an issue where a required Select All That Apply field prevented other conditional rules from working. Visibility and required rules based on a value in a required Select All That Apply field (for example, "Other") did not trigger. A field with a "Visible if Yes/No field = Yes" rule that followed a required Select All That Apply field could also appear when the Yes/No field was blank. These issues have been resolved.

FASAMS Adjustments	*Main Menu > Admin Tools > State Reporting > FASAMS* There was an issue where the FASAMS Services export included services that should not have been reported, such as services from programs that do not report to FASAMS. There were also issues where some Services export values did not follow the documented FASAMS configuration. The Services export now works as follows: • Services are included only when the client is admitted to a program that reports to FASAMS (**Program** Reporting Template, FASAMS-Type = Yes) and the client's Face Sheet field with the alias **IncludeInFASAMS** is set to Yes. Sites must assign the **IncludeInFASAMS** alias to their client opt-in field. • A service is sent only when its activity appears in the **FASAMS Activity** Reporting Template. Services with activities that are not in the template are excluded. • The Service Type Code defaults to 1 unless a FASAMS-TypeCode override is set on the activity in the **FASAMS Activity** Reporting Template. • The Service Program Area Code is taken from the Program Area on the client's admission (POM), and can be overridden with FASAMS-ProgramAreaCode in the **FASAMS Activity** Reporting Template. POM values 5 and 6 are not valid for Service Events, and by default 5 is mapped to 1 and 6 is mapped to 3. • POMs and Evaluations that fall outside the episode's admission and discharge dates are no longer exported. • Evaluation forms are read from the **EvaluationForms** option in the **FASAMS Agency** reporting template. The Service County Area Code is read from that same template.
